(54) Information Display Operating Device and Information Display Operating System

(57) [Abstract]

[Problem To Be Solved] To provide an information display operating device where an input is surely realized with favorable operability.

[Solution Means] Information is displayed on a display DP, and the communication and the changeover of information are executed by switch operating means CSW1 in the information display operating device CP2, in which the switch operating means CSW1 is arranged at the right and left edges of the display DP, so that the opaque material of the constituent materials of the switch operating means CSW1 is arranged at the outside of the display of the display DP, and only transparent materials can be arranged in the display DP. Thus, a switch operation is executed while viewing the function of the switch operating means CSW1, and magnified display of the entire screen also is possible without the influence of the existence of the switch operating means CSW1. Moreover, the switch operating means CSW1 can be constituted to have a stroke feeling and a click feeling, and a grip feeling is given by providing a projecting part P on the back surface, so that an operation environment such that input is surely realized with favorable operability can be obtained.
